

ABSTRACT OF THE DISCLOSURE

A method is disclosed for remote monitoring of a premises, comprising the steps of
operatively coupling a geographically remote client to a security system server which is capable
5 of authenticating a user of the remote client, operatively coupling the remote client to a security
gateway which is capable of managing the monitoring of the premises, activating a signal at the
premises for notifying an occupant at the premises that remote monitoring is occurring, and
transferring information between the security gateway and the remote client. The transfer of
information between the security gateway and the remote client is controlled by the user of the
10 remote client. The security gateway may be operably coupled to at least one camera at the
premises and to at least one audio station at the premises.

The notification signal may comprise an audible signal or a visible signal or both. An
audible notification signal may comprise a sound uniquely associated with the remote user, and
can comprise speech, which may identify the remote user. A visible notification signal may
15 comprise a depiction of the remote user, or a graphical image, or an alphanumeric message,
which may identify the remote user, and which may be transmitted to a keypad at the premises.
The visible notification signal may be transmitted to a display device, such as a television. The
visible notification signal may further comprise an activation signal for a light source at the
premises, such as a light emitting diode (LED). The LED may be located on a camera or on a
20 keypad, for example.
